No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

Use of NM23 polypeptide and nucleic acid, for diagnosis, prevention, and treatment of skin and intestinal diseases, and in screening for

Claim 1; Page 21-22; 48pp; German.

therapeutic agents.

This invention describes a novel use of the NM23 protein family, for analysis, diagnosis, prevention and/or treatment of skin or intestinal diseases and/or wound healing and/or associated pathological disturbances. The products of the invention have vulnerary, antitumour, gastrointestinal, dermatological, anti-inflammatory and antiulcer activity. The NM23 protein family act as nucleotide-diphosphate kinases, DNA-binding and transcription activating agents and regulators of Ras-

           them, and their encoding nucleic acids, or related vectors, transformed cells and antisense sequences, are used for analysis, diagnosis, prevention and/or treatment of skin and intestinal diseases (where associated with uncontrolled tissue growth or cell differentiation, particularly skin and intestinal tumours, also psoriasis, Crohn's disease and ulcers), wound healing and/or associated pathological alterations). They are also used to screen for agents that are potentially useful for treating these conditions. In vitro monitoring of NM23 protein expression in tissue samples provides an early diagnosis of disease. This sequence represents the murine NM23A protein described in the method of the

                                                                                      The invention relates to polynucleotides (AAK51456-AAK53435) and the encoded polypeptides (AAW8329-AAM80302) that exhibit activity elating to cytokine, cell poliferation or cell differentiation or which may induce production of other cytokines in other cell populations. The polynucleotides and polypeptides are useful in gene therapy, vaccines or peptide therapy. The polypeptides have various cytokine-like activities, e.g. stem cell growth factor activity, immunomodulatory activity and activity, tissue growth factor activity, immunomodulatory activity and activity inhibin activity and may be useful in the diagnosis and/or treatment of cancer, leukaemia, nervous system disorders, arthritis and inflammation. Note: Records for SEQ ID NO 2110 (AAK52581), 2111 (AAK52582) and 3666 (AAM80020) are omitted as the relevant pages from the

                                                                                        polynucleotides (I) and polypeptides (II) used in a method of detecting cancer in a patient. The method is optionally performed by utilising cancer in a patient. The method is optionally performed by utilising cancer in a patient. The method is optionally performed by utilising contacted with (III), where the biological sample from the patient is contacted with (III), detecting the amount of polynucleotide hybridised to (III) in the sample and comparing the amount of polynucleotide to a predetermined cut-off value and thereby determining cancer in a patient.

(I), (II) or antigen-presenting cells expressing (II) is useful for a timulating and/or expansion of the components under compositions to permit the stimulation and/or expansion of the cells. A composition comprising (I) is useful for stimulating an immune response in a patient and for inhibiting the development of a cancer especially lung cancer in a patient. An isolated T cell population is useful for removing tumour cells from the biological sample and for inhibiting the development of cancer in a patient. Adulg4907-Adul9431 represent novel tuman lung small cell cancer antigen amino acid sequences of the

Analyzing differential protein expression associated with histopathologic features of breast disease, comprises detecting overexpression or underexpression of pool of proteins having Afadin, Aurora A, in breast
                                                                                                                                                                                                                                                                                                                                                                                                                                                           ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         63 KEHYTDLKDRPFFTGLVKYMHSGPVVAMVWEGLNVVKTGRVMLGETNPADSKPGTIRGDF 122
                                                                                                                                   The invention relates to novel biomarkers for liver diseases. The invention also relates to the use of an autoantigen screening method to identify biomarkers that can be used in detecting liver diseases such as liver cirrhosis and liver cancer. The present sequence is the human NM23 protein. This sequence is the autoantigen identified from cell lines using sera of patients with liver cirrhosis and liver cancer.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    62
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      92
New biomarker for liver diseases comprising specific sequences, useful for developing kits for disgnosing liver cirrhosis or liver cancer.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     3 QPAVKPCHLKGTMANSERTFIAIKPDGVQRGLVGEIIKRFEQKGFRLVGLKFLQASEDLL

process by process or particular breast tumores, e.g. breast carcinomas, comprising detecting the overexpression or underexpression of a pool of proceins in breast tissues or cells. The pool comprises all or part of a protein set comprising: afadin, aurora A, alpha-catenin, beta-catenin, BCL2, cyclin CDL, cyclin E, cytokeratin SA, cytokeratin SA, cytokeratin SE, angl, aurora B, BCRP1, rathepsin D, CDIO, CD4, CKI4, CCC, TACC3, rytokeratin G, cytokeratin 18, angl, aurora B, BCRP1, cathepsin D, CDIO, CD4, CKI4, CCC, cytokeratin SE, angl, aurora B, BCRP1, cathepsin D, CDIO, CD4, CKI4, CCC, cytokeratin SE, angl, aurora B, BCRP1, cathepsin D, CDIO, CD4, CKI4, CCC, cytokeratin SE, angl, aurora B, BCRP1, cathepsin D, CDIO, CD4, CKI4, CCC, cytokeratin SE, angl, aurora B, BCRP1, cathepsin D, CDIO, CD4, CKI4, CCC, cytokeratin SE, angl, aurora B, BCRP1, cathepsin D, CDIO, CD4, CKI4, CCC, cytokeratin SE, angl, aurora B, BCRP1, cathepsin D, CDIO, CD4, CKI4, CCC, cytokeratin SE, angl, such CCC, cytokeratin SE, angl, such CCC, cytokeratin SE, angl, such CCC, cytokeratin SE, cytokeratin SE, CCC, cytokeratin SE, CCC, cytokeratin SE, cytokeratin SE, CCC, cytokeratin SE, cytokeratin 
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              a patient can be based on the analysis of the differential protein expression profile. Breast cancers can be classified into prognostically relevant subclasses, and appropriate doses and/or schedule of chemotherapeutics and/or biopharmaceuticals and/or radiation therapy can be selected to circumvent toxicities in a patient. The method is also useful in assessing breast cancer heterogeneity and prognosis in patients with stage I, II or III disease. The present sequence is that of NM23.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           122
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            77 KEHYVDLKDRPFFAGLVKYMHSGPVVAMVWEGLNVVKTGRVMLGETNPADSKPGTIRGDF 136
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               94
The present invention provides a method for analyzing differential protein expression associated with histopathological features of breast
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           63 KEHYTDLKDRPFFTGLVKYMHSGPVVAMVWEGLNVVKTGRVMLGETNPADSKPGTIRGDF

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    셤
```

```
which is found on chromosome 17q21. Its coding sequence was isolated by searching a human fibroblast CDNA library for sequences similar to pnm23-M1. Nm23 proteins are involved in tumour metastasis, and this protein, its gene and antibodies can be used to determine an individual's susceptibility to cancer and the likelihood of tumour metastasis within that individual. This is possible using a number of methods, including
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               63 KEHYTDLKDRPFFTGLVKYMHSGPVVAMVWEGLNVVKTGRVMLGETNPADSKPGTIRGDF 122

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    8
                                                                                                                                                                                         The invention relates to an isolated polynucleotide molecule encoding a human nm23 protein comprising nm23-H1 having a sequence of 746 base pairs (bp) fully defined in the specification or nm23-H26 having a sequence of 670 bp fully defined in the specification. The polynucleotide molecule of the invention is useful as a diagnostic tool for detecting and/or determining RNA or DNA which can be employed to detect mNNA expression in cancer cells to aid in predicting the mailgnant potential of a human tumour. The DNA and the antibodies may also be used to detect abnormalities of DNAs in normal or cancer cells to aid in predicting the genetic predisposition for developing cancer. The human nm23 protein can be employed to produce mn23 antibodies. This sequence represents the nm23 HI protein of the invention
                                                                                                                                                                                                                                                                                                                                                                                          ö

These proteins are products of different genes, with NM23-H1 being localised to chromosome 17. These proteins are used to predict aggressiveness (metastatic potential) of human tumours and in genetic tests for cancer susceptibility, diagnosis and prognosis, also for selection of treatment, e.g. susceptibility to early-onset familial breast cancer. Gene nm23 may contribute to tumourigenicity and alteration in its regulation may be an early stage in the metastatic cascade. Allelic or homozygous deletion of the gene is detected in some primary
                                                                                                                                                                                                                                                                                                                                                       New human NM23 protein, useful for diagnosis and prognosis of cancer, and assessment of aggressiveness and susceptibility.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       63 KEHYTDLKDRPFFTGLVKYMHSGPVVAMVWEGLNVVKTGRVMLGETNPADSKPGTIRGDF 122

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        encoding such proteins. PKIN sequences of the invention are useful for diagnosing, treating or preventing disorders associated with aberrant expression of PKIN, particularly immune system disorders (e.g. acquired immune deficiency syndrome (AIDS), thymic hypoplasia, Crohn's disease, anaemia, asthma), neurological disorders (e.g. epilepsy, Charcot-Marie-Tooth disease or seizures), cell proliferative disorders (e.g. cancers such as adenocarcinoma, leukaemia, lymphoma, melanoma, myeloma, sarcoma), and developmental disorders (e.g. Down's syndrome). They are also used in gene therapy and protein therapy. The present sequence is human PKIN-19
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        New human kinases, useful for diagnosing, treating or preventing immune system disorders (e.g. Crohn's disease), neurological disorders (e.g. epilepsy), or cell proliferative disorders (e.g. cancers such as leukemia
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          64 EHYTDLKDRPFFTGLVKYMHSGPVVAMVWEGLNVVKTGRVMLGETNPADSKPGTIRGDFC 123
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          The present invention relates to human kinases (PKIN) and polynucleotides
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             75 EHYVDLKDRPFFAGLVKYMHSGPVVAMVWEGLNVVKTGRVMLGETNPADSKPGTIRGDFC 134

This invention describes novel cytostatic polynucleotide and polypeptide sequences which can be used in a method for diagnosing prostatic cancer or the risk of developing prostatic cancer. Diagnosis is based on determining over transcription or over expression of the sequences in prostatic tissue. Screening for inhibitors of the sequences or detection substances involves a binding assay, any compounds that bind are selected, optionally after deconvolution of mixtures. Detection of a predetermined minimum level of the reporter indicates the presence of tumour cells. Inhibitors can be chosen from antisense oligonucleotides, short-interfering RNA or ribozymes; an organic molecule of molecular weight below 5000, preferably 300, that binds to the polypeptide; an aptamer against the polypeptide; a (monoclonal) antibody (Ab) against the colypeptide, preferably humanised or human; an anti-idiotype, non-human complying a reporter group, cell toxin, immunostimulatory molecules and/or with a reporter group, cell toxin, immunostimulatory molecules and/or radioisotope. The polymuleotides are identified in human prostatic cancer by differential expression analysis, using DNA microarrays, between normal and tumorous tissues, with (over) expression being detected by quantitative PCR. Analysis of prostatic cancer samples showed that CD24 was upregulated in many of them. Sections of tissue, isolated from prostatic cancer patients, or subjects at risk, were incubated concer patients, or subjects at risk, were incubated second antibody; streptavidin-conjugated horseradish contextained with hemalum (blue). Malignant cells stained servond sumbrane and cytoplasmic staining was very strong, and propredice ago etained. ADR66954 represent the context also stained. ADR66954 represent the invalue.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   14 TWANSERTFIAIKPDGVQRGLVGEIIKRFEQKGFRLVGLKFLQASEDLLKEHYTDLKDRP

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       This invention describes novel cytostatic polynucleotide and polypeptide sequences which can be used in a method for diagnosing prostatic cancer. Or the risk of developing prostatic cancer. Diagnosis is based on determining over transcription or over expression of the sequences in prostatic tissue. Screening for inhibitors of the sequences or detection broatances involves a binding assay, any compounds that bind are substances involves a binding assay, any compounds that bind are selected, optionally after deconvolution of mixtures. Detection of a predetermined minimum level of the reporter indicates the presence of tumour cells. Inhibitors can be chosen from antisense oligonucleotides, consistent farmer against the polypeptide; an expanic molecule of molecular aptamer against the polypeptide; a (monoclonal) antibody (Ab) against the polypeptide; a (monoclonal) antibody (Ab) against the polypeptide; an anti-idictype, non-human (monoconal) antibody directed against Ab or any of the above derivatised with a reporter group, cell toxin, immunostimulatory molecules and/or radioisotope. The polynucleotides are identified in human prostatic cancer by differential expression analysis, using DNA microarrays, cancer by differential expression analysis, using DNA microarrays.

Cancer by differential and tumorous tissues, with (over) expression being detected by quantitative PCR. Analysis of prostatic cancer samples showed that CD24 was upregulated in many of them. Sections of tissue, isolated from

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     61 FraglukymhsgpvvamvmeglnvvktgrvmlgetnpadskpgtirgdfciqvgRniihg 120
prostatic cancer patients, or subjects at risk, were incubated sequentially with anti-human CD4 murine monoclonal antibodies; blotinylated second antibody; streptavidin-conjugated horseradish peroxidase and then diaminobenzidine as colour former (brown). The samples were counterstained with hemalum (blue). Malignant cells stained atrongly but non-malignant cells only weakly. In 15 of 63 samples of adenocarcinoma, membrane and cytoplasmic staining was very strong, and lymph node metastases were also stained. ADR65805-ADR66954 represent the polymucleotide and polypeptide sequences used in the method of the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             The invention relates to nucleoside diphosphate kinase 19.47 (ABB99909) and nucleic acids encoding it (ABG77987). The protein has a malecular weight of 19.47 kD. The invention also relates to a method for the recombinant production of the protein, an antagonist of the protein, and the use of the protein, gene and antagonist in therapeutic applications. Nucleoside diphosphate kinase 19.47 can be used in the treatment of a variety of diseases such as tumours, embryonic development disorders and
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  9

The present sequence represents human nm23-H1 protein. The specification describes a method for the diagnosis of metastatic potential of a carcinoma in a patient. The method comprises obtaining a sample of chromosomal DNA from the tumour of the subject, and analysing the sample of chromosomal DNA from the tumour of the subject, and analysing the sample of chromosomal DNA for the presence or absence of a human nm23-H1 allele. The absence of a human nm23-H1 allele subject has previously had or currently has breast carcinoma, non-small cell lung carcinoma or kidney carcinoma. The metastatic potential is due to allelic deletions in the human nm23 quer, nm23-H1. The method can also be used for the diagnosis of colorectal carcinoma or neuroblastoma in patients who have had or currently have such carcinoma

This nm23 protein is useful for raising antibodies for detecting tumours having low levels of mm23 protein and thus an increased ability to undergo metastasis or be malignant. See also

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             The sequences given in AAG79335-38 show the related human proteins NM23-H1 and H2S. These proteins are products of different genes, with NM23-H1 abing localised to chromosome 17. These proteins are used to predict aggressiveness (metastatic potential) of human tumours and in genetic tests for cancer susceptibility, diagnosis and prognosis, also for selection of treatment, e.g. susceptibility to early-onset familial breast cancer. Gene nm23 may contribute to tumourigenicity and alteration in its regulation may be an early stage in the metastatic cascade. Allelic or homozygous deletion of the gene is detected in some primary
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             ô

               A.Accession: T14183
A.Status: preliminary; translated from GB/EMBL/DDBJ
A.Status: preliminary; translated from GB/EMBL/DDBJ
A.Wolecule type: mRNA
A.Wolecule: 1-148 «GRA>
A.Residues: 1-148 «GRA>
A.Cross-references: UNIPROT:096559; UNIPARC:UP1000012FEAB; EMBL:U72142; NID:g1619957; PI
C.Function:
A.Bescription: catalyzes transfer of the gamma-phosphate group from ATP to nucleoside di
cid synthesis, UTP for polysaccharide synthesis, CTP for lipid synthesis and GTP for pro
by modulating GTP levels
C.Superfamily: nucleoside diphosphate kinase
C.Superfamily: phosphotistidine; phosphotrein; phosphotransferase; pyrimidin
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          nucleoside-diphosphate kinase (EC 2.7.4.6) [validated] - Neurospora crassa Nicontains: protein kinase (EC 2.7.4.6) [validated] - Neurospora crassa Cispeciase: Neurospora crassa (Cispeciase: Neurospora crassa (Cispeciase: Neurospora erassa (Cispeciase: Neurospora erassa (Cispeciase: 09-Jun-2000 #sequence_revision 09-Jun-2000 #text_change 09-Jul-2004 (Cispeciase: 09-Jun-2004 #sequence_revision 09-Jun-2000 #text_change (N.; Hasunuma, K.
